

Improving product discoverability for a returning user.

Chhavi Chauhan — Case Study, August 2025

PRODUCT MANAGEMENT

20

Users studied

18/20

Never buy in first session

#1

RICE-ranked solution

PROBLEM STATEMENT

Returning users can't find products they've already seen.

According to a UX study, the discoverability of a product is difficult for a returning user. The customer journey is tedious — finding an existing product or offer a second time is complex, requiring the user to repeat the entire browsing flow.

18/20

Users never buy in their first session — they always return for a second visit to complete the purchase.

0

Ways to find a previously viewed product without repeating the full browsing journey from scratch.

8

Steps a user must take in the current flow just to relocate a product or offer they already found before.

Three questions revealed the depth of the drop-off.

Q1

Do they explore the products and offers listed on CRED?

- The majority of users said they always check the discount on other apps before buying something on CRED — delaying the purchase.

Q2

If they like something — a travel offer or a product — do they buy it in their first session?

- All 18 of the 18 users who responded said they never buy in their session — the buying decision always happens on a second visit.

Q3

Do they come back to check or buy the same product or offer again?

- When they return, there is no shortcut — they must scroll through the full shop journey again, with no search or history feature.

CURRENT FLOW

Eight steps to find something you've already found before.

1

Opens the app

2

Goes to the Shop category

3

Chooses Store or Travel tab — two separate categories

4

Scrolls down to explore offers in one of the tabs

5

Finds a product or offer suitable for them

6

Drops off — compares prices on other platforms or asks friends

7

Returns — must scroll again from the beginning to find the same item (no search bar)

8

Product may be gone or buried — user can't find it again

Steps 6–8 are where users drop off. **There is no way to pick up where you left off.**

Three distinct behaviours across the user base.

PERSONA 01

The Bill Payer

Uses CRED purely to pay credit card bills. Never explores products, offers, or coins. The app is a utility — not a discovery platform.

PERSONA 02

The Discount Hunter

Pays bills through CRED but also monitors products and offers. Opens the app to browse deals, then compares prices on other platforms before deciding.

PERSONA 03

The Explorer

Opens the app daily to see what's new. CRED's lifestyle products differ from other e-commerce platforms. They browse continuously — and buy when they find something they like.

Personas 02 and 03 are most impacted by the discoverability problem — they return to buy but can't find what they saw.

PROPOSED SOLUTIONS

Two ways to bring back previously seen products.

1 "Explore Again" on the Homepage

A horizontal scroll rail of previously visited products placed on the landing page under an "Explore again" headline — visible to every user with no additional action required.

PROS

Maximum reach — on the main page. No user action needed to access it.

CONS

Accidental clicks on an offer could surface it repeatedly, which some users may find intrusive.

2 "Like" Button Wishlist

A like button on every product listing. Liked items are saved and accessible through a dedicated wishlist tab in the shop category — available across Store and Travel.

PROS

Reduces steps in journey. Saved data can be used for preference-based recommendations.

CONS

Lower reach — requires deliberate user action. Time spent in games/offers may shift away from discovery.

PRIORITIZATION — RICE FRAMEWORK

Solution 1 scores highest across all four dimensions.

SOLUTION	REACH	IMPACT	CONFIDENCE	EFFORT	TOTAL
"Explore Again" on Homepage ← recommended	5	3	4	3	20
"Like" Button Wishlist	4	4	4	4	16

- Scale: 1 = Very Low 2 = Low 3 = Medium 4 = High 5 = Very High
- Solution 1 wins on **Reach** — visible to all users on the homepage with no action required

WINNING SOLUTION

"Explore Again" — how it works.

- 1 User browses Shop**
Opens app, navigates to Shop → Travel or Store, scrolls through listings.
- 2 Views a product listing**
Clicks on an offer they like. Visit is recorded by the backend automatically.
- 3 Returns to the app**
On the homepage, after any mandatory actions, the "Explore Again" rail appears automatically — no search, no scrolling.
- 4 Picks up where they left off**
Scrolls the horizontal rail and taps the previously seen product to complete the purchase.

BACKEND CONFIG RULES

Placement Rule

"Explore Again" is always the first section after mandatory actions (e.g. bill reminders).

Tracking Rule

Visited products and offers are recorded per user. Engineering effort is minimal — the design mirrors existing landing page patterns.

No-Actions State

If no mandatory actions exist, "Explore Again" shows at the very top of the homepage.

WIREFRAME

"Explore Again" on the homepage — three states.

STATE 1

STATE 2 — SCROLLING

STATE 3 — MORE ITEMS

Design matches existing patterns — engineering effort is minimal. The "Explore Again" rail is placed immediately after any mandatory actions, ensuring maximum visibility with zero friction.

NEW USER FLOW

From 8 steps to 2 — the simplified return journey.

Previously: **8 steps**
Now: **2 steps**

75%
REDUCTION

User no longer needs to navigate to Shop, choose a category, or scroll to re-find a product. The homepage does the work.

SUCCESS METRICS

What we measure to know if it's working.

PRIMARY METRIC

Conversion Rate

Success means conversion rate increases as the "Explore Again" feature is exposed to more users. Track CTR on the rail and purchases of previously viewed products.

SECONDARY METRIC

Products Bought per User

If the number of products bought per user increases over the measurement period, we've solved the user problem — with the additional benefit of increased revenue.

TRACKING WINDOW

1-Month Post-Launch

Both primary and secondary metrics are tracked closely for 1 month post-implementation in each phase to evaluate rollout readiness before scaling.

A phased rollout — starting with the highest-intent users.

PHASE 1 A/B Test — High-Intent Users

- Expose the feature via A/B test to a small group of **high-intent users** — defined as those visiting the app more than twice per day.
- Track **CTR** on the "Explore Again" rail and **purchase rate** of previously viewed products.
- Primary success metrics tracked closely for **1 month** post-implementation.

PHASE 2 Scale to Daily Active Users

- Expand to users who open the app **at least once per day** — broader than Phase 1's high-intent cohort.
- Track the same metrics: CTR on the rail and purchase rate of previously viewed products.
- Monitor both metrics for **1 month** post-implementation before considering full rollout.
